1. Introduction

The retail industry is one of the industries that is growing in fast pace where the number of retail business keep on increasing from time to time in order to meet the demand from consumers of specified areas. Thus, the nature of retail business required a good management of inventory level in order to meet the demand of the customers. The traditional way retailer keeps their sales and inventory details is in spreadsheets which are not effective anymore when the size of the shop gets bigger. This is because more items will be made available in a larger quantity, thus tracking the sales made with inventory level in the shop would be complicated and time consuming for the retailer. Besides, the situation gets worst when the retailer does not have proper method to determine items purchased by their customers.

Thus, this project will provide solution for retailers that are still using traditional way in keeping their inventory data like Koala PC Sdn. Bhd by creating Computer Store Management system. Computer Store Management System is a computer- based system that provides the shop structure for maintaining and controlling goods to be stocked. The approach of Computer Store Management System is commonly used to avoid product overstock or outrages by integrating daily 'Point of Sales' with store's inventory level. As the available existing system provides limited functions to the user.

Thus, this project will contain enhanced and more flexible functions to the store. To provide function to manage goods in the store more efficiently. Basic functions such as 'add', 'delete', and 'update' for data management will be made available. This project used:

1. WampServer as the server
2. CakePHP as the framework

2. User Manual

2.1. Home Page

1. Browser and open the following URL to go to main page:

http://localhost/computer_store/comp

2. This page will appear.
